Bird recognition in the city of Peacetopia (case study)

Quiz, 15 questions

14.5/15 points (96.66%)

### **Problem Statement**Bird recognition in the city of Peacetopia (case study)

Quiz, This exismsple is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have to build an algorithm that will detect any bird flying over Peacetopia and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- · What is the evaluation metric?
- How do you structure your data into train/dev/test sets?

## Metric of success Bird recognition in the city of Peacetopia (case study)

Quiz, Three Citip Council tells you that they want an algorithm that

14.5/15 points (96.66%)

- 1. Has high accuracy
- 2. Runs quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

<u>Note</u>: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and will slow down the speed with which your team can iterate. True/False?

Corre	True ect	,		, <b>,</b> , , , ,		
0	False					
<b>~</b>	1 / 1 point					

2.

After further discussions, the city narrows down its criteria to:

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

Test Accuracy	Runtime	Memory size
97%	1 sec	ЗМВ
Test Accuracy	Runtime	Memory size
99%	13 sec	9МВ
Test Accuracy	Runtime	Memory size

# Bird recognition in the city of Peacetopia (case study) Quiz, 15 questions 14.5/15 points (96.66%)

Quiz, 13 question

Test Accuracy	Runtime	Memory size
98%	9 sec	9MB

#### Correct

Correct! As soon as the runtime is less than 10 seconds you're good. So, you may simply maximize the test accuracy after you made sure the runtime is <10sec.

1/1 point

3.

Based on the city's requests, which of the following would you say is true?

Accuracy is an optimizing metric; running time and memory size are a satisficing metrics.

#### Correct

$\bigcirc$	Accuracy is a satisficing metric; running time and memory size are an optimizing metric.
$\bigcirc$	Accuracy, running time and memory size are all optimizing metrics because you want to do well on all three.
$\bigcirc$	Accuracy, running time and memory size are all satisficing metrics because you have to do sufficiently well on all three for your system to be acceptable.

1/1 point

4.

### **Structuring your data**

Before implementing your algorithm, you need to split your data into train/dev/test sets. Which of these do you think is the best choice?

	Train	Dev	Test
--	-------	-----	------

Train 6,000,000	Dev 3,000,000	Test 1,000,000
0,000,000	3,000,000	1,000,000
Train	Dev	Test
6,000,000	1,000,000	3,000,000
Train	Dev	Test
9,500,000	250,000	250,000

**/** 

1/1 point

5.

After setting up your train/dev/test sets, the City Council comes across another 1,000,000 images, called the "citizens' data". Apparently the citizens of Peacetopia are so scared of birds that they volunteered to take pictures of the sky and label them, thus contributing these additional 1,000,000 images. These images are different from the distribution of images the City Council had originally given you, but you think it could help your algorithm.

You should not add the citizens' data to the training set, because this will cause the training and dev/test set distributions to become different, thus hurting dev and test set performance. True/False?

True

False

#### Correct

Adding this data to the training set will change the training set distribution. However, it is not a problem to have different training and dev distribution. On the contrary, it would be very problematic to have different dev and test set distributions.

## Bird recognition in the city of Peacetopia (case study)

14.5/15 points (96.66%)

1	_	
П	)	

One member of the City Council knows a little about machine learning, and thinks you should add the 1,000,000 citizens' data images to the test set. You object because:

The test set no longer reflects the distribution of data (security cameras) you most care about.

#### Correct

A bigger test set will slow down the speed of iterating because of the computational expense of evaluating models on the test set.

#### **Un-selected is correct**

This would cause the dev and test set distributions to become different. This is a bad idea because you're not aiming where you want to hit.

#### Correct

The 1,000,000 citizens' data images do not have a consistent x-->y mapping as the rest of the data (similar to the New York City/Detroit housing prices example from lecture).

#### **Un-selected is correct**

### 7. Bird recognition in the city of Beacetopia (case study)

14.5/15 points (96.66%)

Quiz, 15 questions

Training set error	4.0%	
Dev set error	4.5%	

This suggests that one good avenue for improving performance is to train a bigger network so as to drive down the 4.0% training error. Do you agree?

$\bigcirc$	Yes, because having 4.0% training error shows you have high bias.
$\bigcirc$	Yes, because this shows your bias is higher than your variance.
$\bigcirc$	No, because this shows your variance is higher than your bias.
	No, because there is insufficient information to tell.

8.

You ask a few people to label the dataset so as to find out what is human-level performance. You find the following levels of accuracy:

Bird watching expert #1	0.3% error
Bird watching expert #2	0.5% error
Normal person #1 (not a bird watching expert)	1.0% error
Normal person #2 (not a bird watching expert)	1.2% error

If your goal is to have "human-level performance" be a proxy (or estimate) for Bayes error, how would you define "human-level performance"?

0.0% (because it is impossible to do better than the	ible to do better than this)
--	------------------------------

0.3% (accuracy of expert #1)

Correct

## 11. Bird reasognition in the cityeds Beason pia (case study)

14.5/15 points (96.66%)

Quiz, 15 questions

Human-level performance	0.1%
Training set error	2.0%
Dev set error	2.1%
Test set error	7.0%

Dev set error 2.1%

Test set error 7.0%

What does this mean? (Check the two best options.)

You should try to get a bigger dev set.

Correct

You have overfit to the dev set.

This should be selected

You should get a bigger test set.

Un-selected is correct

You have underfit to the dev set.
